

INITIAL DRAFT PROJECT PROPOSAL

GROUP 7

8-CAMIA BATCH 2031

PROJECT TITLE: Orga-Notes

The Problem:

Many students or just people in general can be unorganized or feel unmotivated to organize. We will need something that can store a variety of info—and output that info whenever you want.

Project Objectives:

We need:

- To be able to store information
- To be able to output information
- To be able to store answers to equations
- To be able to output those answers
- To be able to input specific dates from the user and add descriptions to those dates
- To be able to output the dates and descriptions
- To be able to promote organized info
- To be able to loop the menu choices until the user chooses to exit
- To be able to utilize txt. files for permanent storage of info

Planned Features:

We plan to have:

- The ability to save the info to a txt. file
- Using datetime.date for the dates
- Math library for sqrt() or pow() if the equation ever requires those
- Looping the menu choices until user exits

Planned Inputs and Outputs:

Pseudocode:

START

Output Initial choices (input info and math, output info and math, input date, exit)

Info, arithmetic, date, or nothing?

(If info,) Input or output?

Input lets you store info in a txt. File

Output lets you output whatever you stored

(If arithmetic), Input or output?

Input lets you store answers to equations in a txt. File.

Output lets you output whatever you stored in that specific index.

(If date), Input or Output?

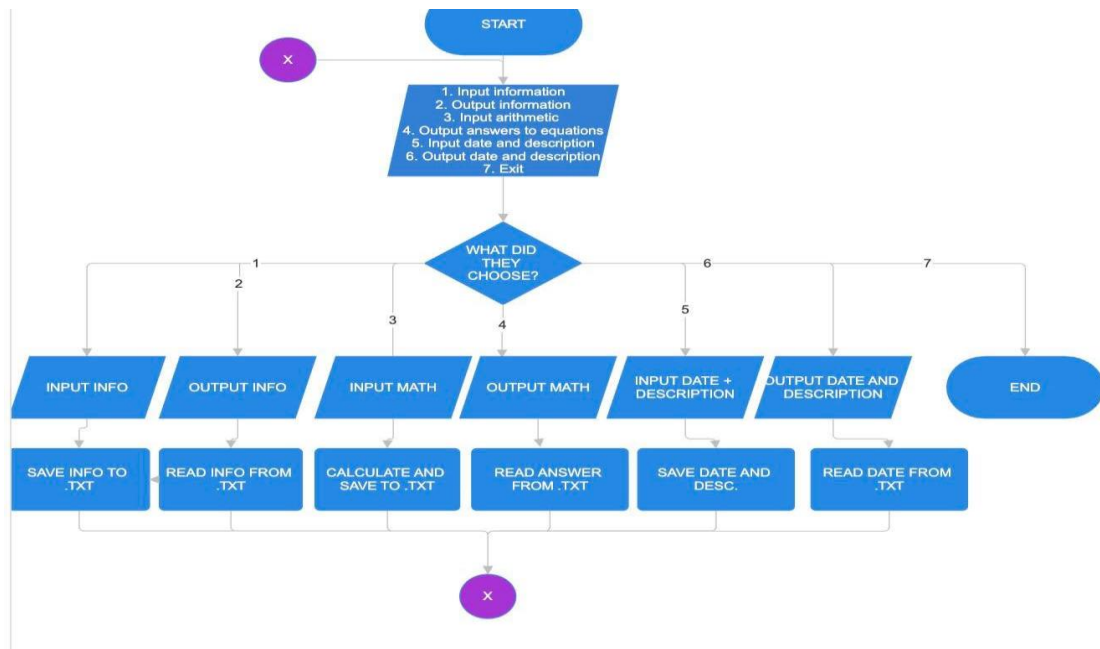

Input lets you store the current date/another date in a txt. File.

Output lets you output whatever you stored.

If exit,

END

Flow chart:

Logic Plan:
